Haq (हक़): Solution Pitch

A voice wage ledger for India's daily-wage workers, built on Gnani AI

हक़

Haq lets a daily-wage worker keep their own proof of work and pay just by speaking.

The problem

India's construction workers are paid in cash, by contractors, with no payslip. 87% are paid below the government minimum wage (Projecthero survey), and unpaid wages are the most common complaint labour helplines handle. In a dispute it is the contractor's register against the worker's memory, and many workers cannot read or write to keep a record.

The solution

At the end of each day the worker speaks in Hindi or Hinglish:

> "आज शर्मा जी की साइट पे काम किया, सात सौ तय हुआ था, चार सौ मिले" (Worked at Sharma ji's site today, agreed ₹700, got ₹400.)

- **Keeps an account per contractor:** days and half days, agreed rate, payments, advances, overtime at double rate, and days pay was refused.
- **Checks every rate against the minimum wage** (central construction rates from 1 Oct 2026, or the worker's state rate) and shows the shortfall in rupees.
- **Speaks every reply and balance back in Hindi,** so the worker never has to read.
- **Produces a printable हिसाब पत्र** (statement of wages due) with the worker's own words for each day, to show a contractor, union or labour office.
- **Seals each record in a SHA-256 hash chain,** so any later edit is detected. Corrections are added, never deleted.

How Gnani AI powers it

Gnani Prisma v3.0 speech-to-text	Transcribes each voice note with spoken amounts as digits. Haq sends the worker's own contractor names and site words as **keyterms**, plus a **topic**, so names and numbers hold up on noisy building sites. Falls back to Prisma v2.5.
Gnani Timbre v2.5 text-to-speech	Speaks every confirmation, balance and full statement in Hindi, including reading the statement aloud to the contractor. Falls back to Timbre v3.0.

Between the two, a rule-based engine reads Devanagari and Roman script alike, understands spoken numbers ("सात सौ") and "kal" for yesterday, and matches "Sharma ji" with "शर्मा जी". Rules keep every money figure predictable and explainable.

Why it matters

Existing apps help workers find jobs or track spending. Haq gives them **evidence**: a dated, sealed record in their own voice, and a clear figure for what the law says they are owed. For workers who can't read, voice is the only way in.

What's next

- IVR number and WhatsApp voice notes for workers without smartphones
- More languages: Bengali, Marathi, Telugu, Tamil
- Dashboard for unions and NGOs to act on disputes

Runs locally in Python with no dependencies; voice clips and records stay on the device. The statement is the worker's own record, not a legal finding. All demo data is synthetic.
